Department of Electrical and Computer Engineering New York University Tandon School of Engineering

March 8, 2018

Outline

In this tutorial, some advanced models will be introduced. For the codes of this tutorial, please check

https://github.com/yunfei-teng/PyTorch-Tutorial

- Normalization
- 2 Autoencoder
- ResNet
- Skip-connection
- U-Net
- 6 VisualBackProp
- Generative Adversarial Nets

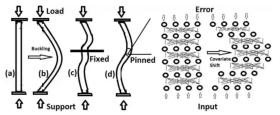

Normalization

Why do we need normalization?

- Batch Norm: Reduce internal co-variate shift.
- Instance Norm: Reduce the influence of contrast.

Actually, instance norm is a special case of batch norm(batchsize = 1).

Batch Norm Paper: https://arxiv.org/pdf/1502.03167.pdf Instance Norm Paper: https://arxiv.org/pdf/1607.08022.pdf

For both, Buckling or Co-Variate Shift a small perturbation leads to a large change in the later.

Debiprosad Ghosh, PhD, Uses Al in Mechanics

Figure: Visual explanation from Quora: Co-Variate Shift

Normalization

Ideally, all the samples are i.i.d, but it's almost impossible. That's why we need normalization.

It not only accelerates the speed of convergence, but also increases the accuracy.

$$\begin{array}{ll} \textbf{Input:} \ \, \text{Values of } x \text{ over a mini-batch: } \mathcal{B} = \{x_{1...m}\}; \\ \quad \text{Parameters to be learned: } \gamma, \, \beta \\ \textbf{Output:} \ \, \{y_i = \text{BN}_{\gamma,\beta}(x_i)\} \\ \\ \mu_{\mathcal{B}} \leftarrow \frac{1}{m} \sum_{i=1}^m x_i \qquad \qquad // \text{ mini-batch mean} \\ \\ \sigma_{\mathcal{B}}^2 \leftarrow \frac{1}{m} \sum_{i=1}^m (x_i - \mu_{\mathcal{B}})^2 \qquad // \text{ mini-batch variance} \\ \\ \widehat{x}_i \leftarrow \frac{x_i - \mu_{\mathcal{B}}}{\sqrt{\sigma_{\mathcal{B}}^2 + \epsilon}} \qquad // \text{ normalize} \\ \\ y_i \leftarrow \gamma \widehat{x}_i + \beta \equiv \text{BN}_{\gamma,\beta}(x_i) \qquad // \text{ scale and shift} \\ \end{array}$$

Autoencoder

Autoencoder is useful for information compression. Training an autoencoder to minimize reconstruction error amounts to maximizing a lower bound on the **mutual information** between input and learnt representation in latent space. [Stacked Denoising Autoencoders]

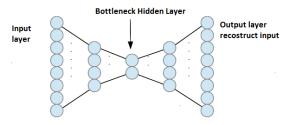

Figure: autoencoder architecture

Extended reading VAE: https://arxiv.org/pdf/1312.6114.pdf)

ResNet

ResNet Paper: https://arxiv.org/pdf/1512.03385.pdf

- Understand why the gradients are unstable. [gradient problem]
- Using residual blocks makes training arbitrarily deep neural nets become possible.

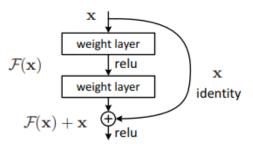

Figure: Residual block

Pre-trained Resnet models are provide in PyTorch: http://pytorch.org/docs/master/torchvision/

Skip-connection

Effect of skip-connection: https://arxiv.org/pdf/1712.09913.pdf

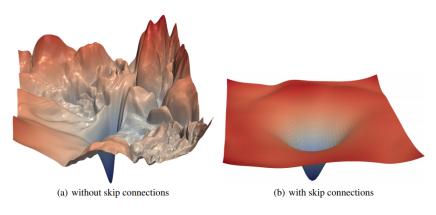

Figure: The loss surfaces of ResNet-56 with/without skip connections.

U-Net

U-Net was first used for image segmentation but it's also a great autoencoder architecture.

U-net Paper: https://arxiv.org/pdf/1505.04597.pdf

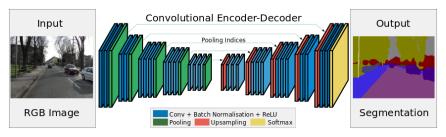

Figure: SegNet

Besides U-Net, another importance concept is Fully Convolutional Networks(FCN). There is no fully-connected layers in FCN.

FCN Paper: https://arxiv.org/pdf/1411.4038.pdf

VisualBackProp: Efficient visualization of CNNs

VisualBackProp Paper: https://arxiv.org/pdf/1611.05418.pdf Intuition: The feature maps contain less and less irrelevant information to the prediction decision when moving deeper into the network.
